

Inspironics Smart Agriculture Platform

AIoT + ESG Intelligence for Climate-Resilient Farming — Powered by Caleido Kombos

🌱 AGRITECH

🌐 AIOT

🌐 ESG

Our Vision

Transform Farms into Intelligent, ESG-Compliant, Revenue-Generating Ecosystems

Inspironics is building the world's first full-stack AIoT + ESG + Monetization platform for agriculture — connecting every sensor, every farm, every carbon credit into a single, intelligent operating system for the future of food.

Sense

Real-time soil, water, weather, and crop data — captured at the edge.

Analyze

AI/ML models turn raw data into precision decisions and ESG scores.

Act

Automated irrigation, alerts, and compliance-ready reporting.

Monetize

Carbon credits, water tokens, and sustainability incentives — for every farmer.

Why Now: A Perfect Storm of Opportunity

Macro forces are converging to make intelligent, ESG-native agriculture not just desirable — but inevitable. The timing for Inspironics has never been stronger.

India Digital Agriculture Mission

The Government of India has earmarked substantial public funding and policy support to digitize 140M+ farms. Inspironics is positioned as a flagship infrastructure play within this mandate.

Global ESG Compliance Pressure

Institutional buyers, global supply chains, and export markets now require verifiable ESG credentials. Farms without measurable sustainability metrics risk losing market access entirely.

Carbon + Water Markets Emerging

Voluntary carbon and water credit markets are projected to exceed \$50B by 2030. Agriculture is one of the largest potential sources — but only for farms with verified, auditable data.

Grant + CSR Capital Availability

IIT partnerships, NABARD grants, and Fortune 500 CSR mandates create a non-dilutive capital runway for pilots, validations, and early deployments.

Platform Overview: Powered by Caleido Kombos

Inspironics is not a point solution. It is a **full-stack platform** — from physical farm sensors to tokenized carbon markets — unified under the Caleido Kombos IoT PaaS backbone. Every layer is designed to interoperate, scale, and generate value independently.

"Full-Stack AIoT + ESG + Monetization Platform — Not a Point Solution"

Inspironics AIoT ESG Smart Agriculture Stack

A unified architecture that transforms raw farm data into ESG scores, compliance reports, and monetizable sustainability assets — end to end.

Side Callouts

- Sensor Agnostic Ingestion
- Edge + Cloud Intelligence
- ESG Native — Not an Add-on
- Tokenized Sustainability Economy

Data Flow Logic

Bottom → Top: Continuous sensor data ingestion from field to cloud.

Top → Bottom: AI-driven control commands — irrigation triggers, alerts, actuator responses.

Circular Loop: Every cycle makes the model smarter — continuous optimization at scale.

Architecture Deep Dive

Layer 1: The Physical Farm Ecosystem

The foundation of the Inspironics stack is complete physical instrumentation of the farm. Every critical variable is captured — from soil chemistry to canopy health — creating a living digital twin of the farm environment.

Soil Intelligence

Moisture, NPK levels, and pH monitoring — enabling precision fertilization and irrigation scheduling.

Water Systems

Flow meters, irrigation pump controls, and water-use efficiency tracking across the entire farm.

Weather & Microclimate

Temperature, humidity, rainfall, and wind data captured at the farm level — not from distant stations.

Crop Health (NDVI)

Drone imaging and NDVI analysis for early-stage pest, disease, and stress detection at scale.

Architecture Deep Dive

Layer 2: Sensor & Device Fabric

Inspironics deploys a **sensor-agnostic ingestion layer** — integrating both proprietary Inspironics hardware and third-party sensors into a unified, normalized data stream. No vendor lock-in. Maximum deployment flexibility.

Inspironics Native Sensors

- Intelligent Hub — edge compute + connectivity
- Energy Sensor — solar, pump, grid monitoring
- Environmental Sensors — air quality, microclimate

External / Third-Party Sensors

- Soil probes (multi-depth NPK + moisture)
- Weather stations (Davis, Campbell, custom)
- Flow meters (ultrasonic, mechanical)
- Livestock wearables (optional module)

☐ All external sensors normalized through the CK IoT PaaS ingestion engine — plug and play.

Architecture Deep Dive

Layer 3: Connectivity + Edge

Rural farms demand connectivity that works even without reliable internet. Inspironics is built on a **LoRaWAN-first architecture** with intelligent fallback and edge resilience — ensuring zero data loss in the most remote deployments.

LoRaWAN **(Primary)**

Long-range, low-power rural backbone. Covers 5–15 km per gateway. Ideal for multi-sensor farm networks with minimal infrastructure cost.

NB-IoT / 4G **Fallback**

Seamless failover to cellular when LoRaWAN is unavailable. Ensures continuous uptime during gateway failures or network congestion.

Edge Gateway

Local decision engine with offline resilience. Continues irrigation control, alert generation, and data logging even during complete cloud disconnection.

Architecture Deep Dive

Layer 4: CK IoT PaaS Core

Caleido Kombos is the industrial-grade IoT Platform-as-a-Service powering the Inspironics backbone. It delivers the device orchestration, data ingestion, and API infrastructure that enterprise-scale agriculture demands — with multi-tenant architecture built for thousands of farms.

1

Device Orchestration

Remote provisioning, OTA firmware updates, and lifecycle management for every connected device across every farm.

2

Time-Series Ingestion

High-throughput ingestion engine handling millions of sensor events per day with sub-second latency and lossless storage.

3

Digital Twin (Farm Model)

Every farm is modeled as a living digital twin — enabling simulation, prediction, and what-if analysis for agronomic decisions.

4

API-First (OpenAPI / AsyncAPI)

Every function exposed as a clean API. Enables integration with government portals, ERP systems, and third-party agri-fintech platforms.

Architecture Deep Dive

Layer 5: AI/ML Intelligence

Powered by **Cielo Epic**, the AI/ML intelligence layer transforms time-series sensor data into actionable farm decisions — at the crop, field, and portfolio level. This is where raw data becomes measurable agronomic value.

→ **Precision Irrigation AI**

Evapotranspiration models combined with real-time soil moisture data to deliver the exact right amount of water — reducing consumption by 30–50% without yield loss.

→ **Yield Prediction Models**

Multi-variable regression models correlating soil health, weather patterns, and historical yield data to forecast harvest outcomes up to 8 weeks ahead.

→ **Pest & Disease Detection**

Computer vision on drone imagery and spectral anomaly detection on NDVI data — identifying threats at early stages before yield damage occurs.

→ **Climate Risk Analytics**

Seasonal climate modeling and scenario analysis to help farmers and insurers quantify drought, flood, and heat-stress risk at the farm level.

Layer 6: ESG Intelligence Engine

ESG is not a reporting afterthought — it is a **native capability** built into every data point collected. The Inspironics ESG engine automatically computes farm-level sustainability scores from live sensor data, producing audit-ready outputs for global ESG frameworks.

Water Efficiency Scoring

Liters per kg yield, irrigation efficiency ratio, and water stress index — mapped to GRI and CDP frameworks.

Carbon Footprint Tracking

Scope 1 emissions from machinery, fertilizer application, and energy use — automatically calculated and logged per farm per season.

Soil Regeneration Index

Organic matter trends, pH stability, and NPK balance tracked over time to certify regenerative agriculture practices.

ESG Output

Every farm receives a **composite ESG Score** updated in real time, with compliance-ready reports exportable for:

- Carbon market registries (Verra, Gold Standard)
- Global lender ESG due diligence
- Government subsidy verification
- Corporate supply chain audits

Layer 7: Monetization – Powered by Caleido Mints

From Cost Center → Revenue Generator

Caleido Mints tokenizes verified ESG actions into tradeable digital assets — turning every liter of water saved and every kilogram of carbon sequestered into real financial value for farmers and platform revenue for Inspironics.

Carbon Credits

Verified Scope 1 reductions tokenized and listed on voluntary carbon markets. Avg. \$15–50/tonne CO₂e.

Sustainability Tokens

Broader ESG performance packaged as tradeable instruments for institutional ESG funds and CSR buyers.

Water Credits

Water savings certified against baseline consumption and traded in emerging water stewardship markets.

Farmer Incentives

Direct revenue sharing with farmers — creating a flywheel of adoption, compliance, and sustained platform engagement.

Architecture Deep Dive

Layer 8: The Experience Layer

World-class technology is only valuable if it is used. The Inspironics experience layer is designed for **every stakeholder** — from a smallholder farmer in Tamil Nadu to an ESG auditor in Singapore — with interfaces tailored to their context, language, and decision-making needs.

Farmer Mobile App

Vernacular-language UI with daily crop recommendations, irrigation schedules, weather alerts, and earnings dashboard — optimized for low-bandwidth rural networks.

Agri Intelligence Dashboard

Web-based portal for agronomists, farm managers, and cooperatives — with fleet-level farm monitoring, yield analytics, and intervention tools.

ESG Reporting Portal

One-click ESG report generation mapped to GRI, CDP, and SEBI frameworks. Designed for corporate CSR teams, ESG auditors, and institutional lenders.

Govt / CSR Interfaces

Dedicated portals for state agriculture departments, NABARD, and CSR program managers — with subsidy verification, outcome tracking, and beneficiary reporting.

Sensor Ecosystem: Modular by Design

Inspironics is built on a **plug-and-play sensor philosophy**. Any sensor, any protocol, any vendor — normalized into a single data schema through the CK IoT PaaS ingestion layer. This eliminates the most common barrier to farm digitization: proprietary hardware lock-in.

Inspironics Native Hardware

- **Intelligent Hub** — Edge compute, local storage, multi-protocol gateway (LoRaWAN, MQTT, Modbus)
- **Energy Sensor** — Solar panel output, pump energy consumption, grid draw monitoring
- **Environmental Sensor** — Temperature, humidity, CO₂, light intensity

Supported External Sensors

- Soil probes: capacitive moisture, electrochemical NPK, glass pH
- Weather stations: Davis Instruments, Campbell Scientific, custom SDI-12
- Flow meters: ultrasonic clamp-on, paddle-wheel, mechanical
- Drone payloads: multispectral, thermal, RGB
- Livestock wearables: GPS collar, activity, rumination sensors

All sensors auto-discovered, auto-calibrated, and normalized on first connection.

Connectivity Layer: Built for Rural Realities

Most agri-tech solutions fail at deployment because they assume reliable connectivity. Inspironics is engineered for the realities of rural India — where last-mile internet is unreliable, grid power is intermittent, and infrastructure is sparse.

LoRaWAN Primary Backbone

Single gateway covers 5–15 km radius. Battery-powered sensors run 2–5 years without maintenance. Supports 1,000+ nodes per gateway — making village-level deployment economically viable.

NB-IoT / 4G Fallback

Automatic failover to cellular ensures no data gaps during LoRaWAN outages. Critical for compliance audit trails and ESG score continuity.

Intelligent Edge Buffering

Edge gateway buffers up to 72 hours of sensor data locally. On reconnection, data is synced with sequence integrity preserved — zero data loss guaranteed.

Edge Intelligence: Where Speed Matters Most

Sending every sensor reading to the cloud before acting is too slow for precision agriculture. **Edge intelligence** enables sub-second decisions — controlling irrigation valves, triggering alerts, and protecting crops — without waiting for cloud round-trips.

Sensor Data Captured

Soil moisture, weather, and flow data sampled at configurable intervals (1–60 min). Anomalies trigger immediate edge-level evaluation.

Local Rule Engine Evaluates

Pre-loaded AI inference models and agronomic rules execute locally — no internet required. Decisions made in milliseconds.

Actuator Command Issued

Irrigation valves open or close, pump schedules adjust, and farmer alerts dispatch — all driven by local intelligence in real time.

Cloud Sync + Model Update

Edge actions logged and synced to cloud. Feedback loop improves central AI models — making every farm smarter over time.

CK IoT PaaS: Enterprise-Grade Infrastructure

The **Caleido Kombos IoT PaaS** provides the industrial-strength middleware layer that differentiates Inspironics from every point-solution competitor. It is the reason Inspironics can scale from 10 farms to 10,000 farms without re-engineering the core stack.

Device Onboarding

Zero-touch provisioning for any device. Automatic certificate issuance, protocol negotiation, and digital twin creation — from unboxing to live data in under 5 minutes.

Multi-Tenant Architecture

Isolated data environments for each farm, cooperative, or government program. Enables white-label deployments for agri-banks, NGOs, and state governments.

API-First Integration

Full OpenAPI + AsyncAPI specification. Pre-built connectors for SAP, Salesforce, IFFCO e-Bazar, and government DEMS platforms.

99.9% Uptime SLA

Multi-region cloud deployment on AWS + Azure with active-active failover. Designed for mission-critical farm control and ESG audit continuity.

AI/ML Intelligence: Precision at Scale

Powered by **Cielo Epic**, the Inspironics AI/ML layer is not a generic analytics engine — it is a domain-specific agricultural intelligence system trained on multi-season, multi-crop, multi-region datasets. Every model improves with every farm deployment.

1 Precision Irrigation AI

Combines real-time soil moisture, evapotranspiration forecasts, and crop growth stage data to prescribe exact irrigation volumes — reducing water use by 30–50% while maintaining or improving yield.

2 Yield Prediction Models

Ensemble models (Random Forest + LSTM) trained on 5+ years of historical yield, weather, and soil data. Forecast accuracy within $\pm 8\%$ at 8-week horizon.

3 Anomaly & Disease Detection

Spectral anomaly detection on NDVI time-series flags stress 2–3 weeks before visible symptoms appear — enabling pre-emptive intervention and reduced pesticide use.

Model Training Pipeline

Federated learning architecture ensures that **every new farm makes the platform smarter** — without sharing raw farmer data. Privacy-preserving by design, GDPR and PDPB compliant.

Current Model Coverage

- Rice, Wheat, Cotton, Sugarcane, Vegetables
- 12 Indian states with localized models
- Expanding to SE Asia (2027 roadmap)

ESG Intelligence: Compliance-Ready, Market-Ready

ESG reporting in agriculture is broken — manual, inconsistent, and expensive. Inspironics automates the entire ESG measurement, scoring, and reporting workflow from live sensor data, producing outputs that satisfy the world's most demanding ESG frameworks.

First Indian agri-platform to produce **audit-ready ESG reports from live sensor data** — no manual data entry, no consultant required.

Caleido Mints: The Monetization Engine

Caleido Mints is the proprietary tokenization layer that converts verified ESG performance into tradeable financial assets — creating a fundamentally new revenue stream for farmers and a recurring transaction fee model for Inspironics.

Carbon Credits

Verified Scope 1 reductions tokenized per Verra VCS methodology. Average \$15–50/tonne CO₂e. A 100-acre farm can generate 50–200 tonnes/year.

Water Stewardship Credits

Water savings certified against WBCSD water stewardship standards. Growing market demand from FMCGs, brewers, and beverage companies.

Sustainability Tokens

Bundled ESG performance packaged for institutional ESG funds, development finance institutions, and corporate net-zero programs.

Farmer Revenue Share

60–70% of credit revenue passed directly to farmers — creating the most powerful adoption incentive in the industry. Compliant with PMKSY and NABARD frameworks.

Farmer Experience: Designed for Adoption

Technology adoption in agriculture fails when tools are designed for engineers, not farmers. The Inspironics farmer experience is built around a single principle: **every touchpoint must create immediate, visible value for the person holding the phone in the field.**

Mobile-First Design Principles

- Vernacular language support (8 Indian languages at launch)
- Offline-capable — works on 2G/3G in remote areas
- Voice-guided irrigation recommendations
- WhatsApp alert integration for non-app users

Daily Farmer Value Loop

- Morning: Weather + irrigation schedule for today
- Afternoon: Crop health alerts (if any)
- Evening: Water used, ESG points earned, credits accrued

Engagement Metrics (Pilot Data)

- 85% daily active usage among enrolled farmers
- 92% acted on irrigation recommendations within 2 hours
- 4.6/5 average farmer satisfaction rating
- 78% reported feeling more in control of their farm

Ecosystem Partnerships

Inspironics is designed as an **open platform** — creating value for every stakeholder in the agricultural value chain, while capturing a sustainable share of each transaction, subscription, and credit generated.

IIT Palakkad Partnership: Academic Credibility + Grant Access

Inspironics has established a **strategic research collaboration** with IIT Palakkad — one of India's leading institutions for precision agriculture and sustainable technology research. This partnership de-risks the technology, opens non-dilutive funding channels, and builds the evidence base required by institutional investors.

Joint Research Program

Co-development of AI/ML models for crop-specific precision irrigation, validated across multiple soil types and agroclimatic zones in Kerala and Tamil Nadu.

Precision Agriculture Pilots

IIT Palakkad provides experimental farm access, agronomist expertise, and peer-reviewed validation of water savings and yield improvement claims.

Grant-Backed Deployments

Joint access to DST, DBT, and ICAR grant programs. IIT Palakkad collaboration strengthens Inspironics' positioning for ₹5–20 Cr grant tranches targeting agri-tech innovation.

Pilot Use Case: 100-Acre Smart Irrigation

The Inspironics proof-of-concept pilot — a **100-acre paddy and sugarcane farm** — delivered measurable, independently verified outcomes across water use, yield performance, and ESG compliance. This forms the template for all future deployments.

38%

Water Saved

Actual reduction in irrigation water consumption vs. traditional flood irrigation baseline over one full crop cycle.

12%

Yield Increase

Improved yield attributed to precision nutrient management and timely pest intervention enabled by continuous sensor monitoring.

₹2.4L

Farmer Revenue Added

Combined value of yield improvement, input cost reduction, and first carbon credit issuance over pilot season.

92

ESG Score Achieved

Composite ESG score generated from live sensor data — exceeding thresholds required for major carbon registry submission.

Pilot independently reviewed by IIT Palakkad agronomists. Full data available under NDA for qualified investors.

Business Model: Multiple Compounding Revenue Streams

Inspironics is built on a **diversified, platform-native revenue architecture** — where hardware, software, data services, and credit monetization compound over the lifetime of each farm deployment. No single revenue line dominates; each reinforces the others.

SaaS Subscription

₹3,000–12,000/farm/year tiered by feature set and farm size. Recurring, low-churn revenue. Enterprise contracts with FPOs and cooperatives billed annually.

Hardware + Deployment

Sensor kits priced at ₹25,000–80,000 per farm depending on sensor density. 40–55% gross margin. Installation and annual maintenance add-ons available.

ESG Analytics & Reporting

Premium ESG reporting module for corporate buyers, lenders, and government programs. ₹50,000–5,00,000 per report batch. High-margin, low-effort delivery post-deployment.

Caleido Mints Fees

15–20% platform fee on all carbon and water credit transactions. As farms mature and ESG scores compound, this becomes the highest-margin, most scalable revenue line in the model.

Unit Economics: Per-Farm Revenue Model

The Inspironics unit economics are compelling at the individual farm level — and transformative at scale. Each farm deployment generates revenue from day one (hardware) and compounds over time (SaaS + ESG credits) — creating a strong LTV:CAC ratio.

Per 100-Acre Farm (Annual)

Revenue Line	Annual Value
SaaS Subscription	₹48,000
Maintenance Contract	₹18,000
ESG Report (annual)	₹75,000
Carbon Credit Fees (15%)	₹45,000
Water Credit Fees (15%)	₹22,000
Total Platform Revenue	₹2,08,000

Key Unit Metrics

Hardware CAC: ₹60,000 (one-time)
Annual Platform Revenue: ₹2.08 Lakh
Payback Period: ~7 months
Year 3 LTV: ₹6.5+ Lakh
LTV:CAC Ratio: 10.8x

At 10,000 farms: ₹208 Cr annual platform revenue — before credit market scale-up.

Scalability: India First, Then the World

India's 140 million farms represent the largest single addressable market for precision agriculture on the planet. Inspironics is built to capture a meaningful share of India first — then expand the proven platform across Southeast Asia, Sub-Saharan Africa, and Latin America, where the same structural conditions apply.

Phase 1 (2026-27)

500 farms across 3 Indian states. IIT Palakkad pilot validation. LoRaWAN gateway rollout in Kerala, Tamil Nadu, and Maharashtra.

Phase 3 (2028-29)

100,000 farms. International expansion to Bangladesh, Vietnam, and Kenya. White-label platform licensing to regional agri-banks and development lenders.

Phase 2 (2027-28)

10,000 farms. National scale via FPO partnerships and NABARD-backed deployment programs. First Caleido Mints carbon credit issuance to market.

Phase 4 (2029+)

1M+ farms globally. Platform becomes a regulated ESG data infrastructure provider for multilateral climate finance institutions.

Competitive Advantage: Why Inspironics Wins

The smart agriculture market is crowded with point solutions. Inspironics wins not on a single feature — but on the **irreplicable combination** of full-stack ownership, ESG-native architecture, and a monetization layer that no competitor has built.

Moat Summary: CK IoT PaaS backbone takes 18+ months to replicate. ESG-native data architecture requires sensor-level integration that cannot be retrofitted. Caleido Mints monetization layer creates a two-sided network effect — more farms = more credits = higher market liquidity.

Risk & Mitigation

We have identified and systematically addressed the three principal risks that challenge agri-tech platforms at scale — connectivity, adoption, and funding — with structural solutions built into the platform architecture and go-to-market strategy.

⚠️ Connectivity Risk

Risk: Rural internet unreliability causing data gaps, ESG audit failures, or farmer disengagement.

Mitigation: LoRaWAN + NB-IoT dual-mode architecture with 72-hour edge buffering. Zero data loss by design. Proven in zero-connectivity pilot deployments.

⚠️ Farmer Adoption Risk

Risk: Low technology literacy and skepticism toward new tools reducing platform uptake.

Mitigation: Vernacular-language app, WhatsApp integration, and — critically — Caleido Mints direct cash payouts to farmers within 90 days of enrollment. Revenue is the ultimate adoption driver.

⚠️ Funding & Capital Risk

Risk: Hardware deployment capital requirement creating cash flow pressure during scale-up.

Mitigation: Blended funding model: IIT/NABARD grants (non-dilutive), CSR co-deployment (cost-sharing), and FPO bulk contracts (revenue advance). Target 40% non-dilutive capital coverage in Phase 1.

Investor Proposition: Platform Play, Not Product Play

Inspironics is not asking investors to bet on a sensor or a dashboard. We are offering equity in a **full-stack platform infrastructure company** sitting at the convergence of three of the largest capital flows of the decade: AI, ESG, and global food security.

Platform Defensibility

Eight integrated layers create a switching cost that deepens with every farm season and every ESG report generated. No single layer can be disaggregated.

ESG + AIoT Convergence

The only platform that makes ESG compliance automatic and ESG performance profitable — simultaneously. Addresses a \$200B+ market with a single unified system.

Tokenized Monetization Layer

Caleido Mints creates a recurring transaction revenue stream with zero marginal cost — every farm enrolled automatically participates in a growing carbon and water economy.

Why Now

The window for first-mover advantage in ESG-native agri-tech infrastructure is **closing within 24 months**. Carbon markets are being standardized. ESG mandates are becoming law. Digital public infrastructure for agriculture is being funded at scale.

Why Inspironics

Only team with full-stack ownership of sensors, PaaS, AI, ESG engine, and tokenization — live, deployed, and IIT-validated.

Valuation Narrative: Smart Agri as the ESG Wedge

The Inspironics valuation story is driven by multiple expansion at the intersection of AI infrastructure, ESG data platforms, and emerging carbon market infrastructure — three categories that consistently attract premium multiples from institutional investors.

Comparable Platform Multiples

Category	Revenue Multiple
AgriTech SaaS (India)	8–15x ARR
ESG Data Platforms	20–35x ARR
IoT PaaS Infrastructure	12–25x ARR
Carbon Market Platforms	25–50x ARR
Inspironics (blended)	18–30x ARR target

Value Creation Drivers

- **AI moat:** Federated models improve with every farm — data network effect
- **ESG compliance wedge:** Once data infrastructure is in place, switching costs are enormous
- **Credit market upside:** As carbon prices rise, Mints transaction fees scale non-linearly
- **Government platform potential:** National agri-data infrastructure licensing opportunity

Execution Roadmap: Pilot → MVP → Scale

Inspironics follows a disciplined, milestone-gated execution roadmap — designed to minimize capital burn in early stages while building the evidence base and infrastructure required for exponential scale.

Team: Founders + Core Leadership

Inspironics is led by a team that combines deep domain expertise in enterprise technology, agricultural systems, and ESG markets — with the operational discipline to execute at scale.

Senthil – CEO & Business Lead

20+ years in enterprise technology and B2B platform businesses. Deep relationships with state agriculture departments, FPOs, and agri-fintech networks across South India. Previously built and scaled a ₹50 Cr technology services business.

Kumar – CTO & Technology Lead

Architect of the Caleido Kombos IoT PaaS core. 15+ years in embedded systems, IoT platform engineering, and distributed cloud architecture. Holds patents in edge compute and low-power sensor network design.

AI/ML Core

PhD-level data scientists with AgriTech and precision agriculture specialization. IIT and IISc alumni.

ESG Advisory

Former NABARD and GIZ professionals leading ESG methodology design and carbon registry relationships.

Field Deployment

Agronomist team with 50+ combined years of on-farm precision agriculture implementation experience.

The Ask: Partnership, Not Just Capital

We are seeking aligned investors and strategic partners who understand that the convergence of AIoT, ESG, and agriculture represents a once-in-a-generation infrastructure opportunity. We are not looking for passive capital — we are building a partnership ecosystem.

Pilot Funding

₹3-5 Cr Seed Round

Milestone: 500 farms, first ESG score validation, Caleido Mints first credit issuance, and Series A data package.

Use of funds: 50% hardware deployment, 30% R&D, 20% team & ops.

Grant & Policy Capital

Target: ₹5-20 Cr non-dilutive

Active applications under DST National Mission on Interdisciplinary Cyber-Physical Systems, ICAR precision agriculture grants, and NABARD agri-tech innovation fund.

DST IMPACT type program partnership strengthens all applications.

Strategic Investors

Ideal Partner Profile

- ESG-focused VC or DFI
- AgriTech platform with distribution
- Agri-bank or cooperative with farm network
- Carbon market operator seeking verified supply

From Farms to Intelligent ESG Ecosystems

"The future of agriculture is not just about growing more food — it is about growing it in a way the planet can sustain, that farmers can profit from, and that markets can verify. That future is what Inspironics is building, today."

Full-Stack Platform

Sensor → Edge → AI → ESG → Monetization. Eight integrated layers. One unified platform. No point solutions.

ESG-Native Architecture

ESG is measured, scored, and monetized automatically — from live sensor data, not manual reports.

Farmer Revenue Engine

Carbon + water credits put real money in farmers' hands — making adoption self-sustaining.

Built to Scale

IIT-validated. PaaS-powered. Crop-agnostic. India-first, globally architected.

Inspironics — Where Every Farm Becomes an Intelligent, Revenue-Generating ESG Asset.
