

Inspironics Talent Engine

Building a Thinking Workforce in Tier-2 India

EXECUTIVE BRIEFING · BOARD & INVESTORS

Context: The Talent Landscape We Are Navigating

Inspironics is actively hiring **Gen Z engineers across South India's Tier-2 cities** — a talent pool that is energetic, digitally native, and cost-effective. However, raw potential alone is insufficient. While technical execution is reasonably strong among fresh graduates, there is a measurable and systemic gap in **structured reasoning, systems thinking, and decision-making under ambiguity**.

This gap, if unaddressed, translates directly into operational inefficiency, cost leakage, and strategic risk at the team level. We need a structured, repeatable system that evaluates true capability — not just credentials — and compensates accordingly.

The Core Challenge

- Abundant supply of engineering graduates in South India
- Strong execution instincts, weak reasoning frameworks
- No standardized evaluation beyond interviews
- Compensation misaligned with actual value delivered

Problem Statement: Why the Status Quo Fails

Degrees ≠ Capability

A B.Tech or Diploma credential signals exposure, not competence. Engineers with identical qualifications deliver wildly different outcomes. Traditional hiring filters miss this entirely, creating mismatched placements from day one.

Uniform Salaries → Inefficiency

Paying all engineers the same salary regardless of thinking ability creates a perverse incentive structure. High-performers are underpaid and leave; low-performers are overpaid and coast. The organization absorbs the delta.

Poor Decisions → Cost Leakage

Engineers who cannot think through trade-offs create downstream rework, misconfigurations, and escalations. Each poor decision compounds into measurable operational cost — often invisible until it becomes a crisis.

- The root cause is structural: without a capability benchmark, compensation is arbitrary and team quality is unpredictable. Inspironics is solving for this at the system level.

Our Solution: The Capability-Based Talent Engine

A four-stage, closed-loop system that transforms how Inspironics evaluates, classifies, and compensates engineering talent — rewarding **thinking, not tenure**.

This engine creates a fair, transparent, and repeatable process that aligns individual compensation with demonstrable capability — making it defensible to candidates, scalable across teams, and compelling as a valuation narrative for investors.

Test Framework: 4 Dimensions of Thinking

General Knowledge

Context Awareness. Tests whether the engineer understands the broader world — industry trends, geography, current affairs — enabling better judgment in ambiguous situations.

Common Sense

Decision Ability. Evaluates practical reasoning and situational judgment. Can the engineer make a sound call with incomplete information? This predicts real-world reliability.

Numerical Reasoning

Cost + Logic Thinking. Assesses quantitative aptitude, ratio analysis, and cost-logic. Engineers who think numerically make better infrastructure and budget decisions.

DevOps Reasoning

System Thinking. Tests understanding of CI/CD pipelines, deployment logic, and system dependencies — the operational backbone of modern engineering delivery.

Scoring Model: Objective, Gated, Transparent

The assessment is designed as a **100-point rubric** across all four dimensions. Candidates are classified into color-coded performance bands based on their total score. Critically, **section gating** ensures that no candidate can score high overall by excelling in just one area — balanced capability is mandatory for advancement. This prevents the common failure mode of hiring specialists who cannot function as generalist decision-makers in a lean Tier-2 team environment.

Performance Bands

Green Band: 75–100

High-capability hire. Strategic asset. Fast-tracked to core engineering roles with maximum compensation.

Amber Band: 60–74

Solid foundation with identifiable gaps. Eligible for structured probation with targeted upskilling.

Red Band: Below 60

Insufficient reasoning capability for deployment. Requires remediation or retest before onboarding.

Compensation Mapping: Pay Linked to Capability

Compensation is not negotiated — it is **derived from the scoring model**. This creates radical transparency for candidates and eliminates managerial discretion that typically introduces bias and compression.

Red Band — ₹10,000/month

Entry-level floor for candidates below threshold. Eligible for reassessment after 90-day structured learning period. Reflects limited deployment readiness.

Green Band — ₹30,000/month

Full deployment compensation for high-capability engineers. Independent ownership of modules and systems. Recognized as core team contributors.

Amber Band — ₹22,000/month

Mid-tier compensation for capable but developing engineers. Assigned structured ownership tasks with mentorship overlay. Progress tracked at 90-day intervals.

Green+ Tier — ₹36,000/month

Elite tier for engineers who demonstrate sustained delivery excellence, proactive problem-solving, and leadership potential. Reserved for top performers post-review.

Total Value Proposition: Beyond the Salary Line

Hidden Value Stack

The Inspironics compensation model includes a structured **perks architecture** that adds approximately **₹6,500/month** in non-cash value to every engineer's total package.

- 🏠 Accommodation support
- 🍽️ Daily food provision
- 🚗 EV mobility & transport
- 🏆 Performance rewards & recognition

This reduces the engineer's effective cost-of-living burden and increases loyalty, retention, and day-one productivity — especially critical in Tier-2 geographies.

Effective Total Compensation by Band

Even at the Amber band, effective total compensation reaches **₹28,500/month** — a compelling package for Tier-2 South India talent markets.

Market Comparison: High Value at Lower Burn

Inspironics' compensation architecture is not just competitive — it is **strategically superior** when adjusted for cost-of-living and effective package value.

Cash Salary ₹K/month

Effective Value ₹K/month

Key Insight: An Inspironics Green-band engineer at ₹30K cash receives ₹36.5K in effective value — equivalent to a ₹40K metro salary when adjusted for local purchasing power. We achieve metro-grade talent outcomes at Tier-2 cost structures.

Strategic Advantage: Why This Model Wins

Pay for Thinking, Not Degrees

Decoupling compensation from credentials creates a meritocratic environment that attracts high-IQ, high-initiative candidates who would otherwise be undervalued by traditional employers. We win the talent arbitrage.

Build High-Leverage Small Teams

A team of five Green-band engineers delivers more measurable value than a team of fifteen average hires. Lean, high-capability teams reduce management overhead and accelerate delivery velocity.

Reduce Operational Risk

Poor decision-making is the silent killer of engineering operations. By screening for reasoning ability up front, we systematically reduce downstream errors, rework cycles, and escalation costs before they materialize.

Progression Model: From Intern to Core Engineer

The capability engine is not a one-time assessment — it is a **living framework** that governs career progression at Inspironics. Every stage is linked to measurable outcomes across three dimensions: capability growth, ownership scope, and delivery maturity.

1

Intern

Assessed on entry. Assigned to shadow projects. Compensated at Red or Amber band based on test score. Learning plan activated immediately.

2

Probation

90-day structured period with defined deliverables. Capability reassessed at milestone. Band upgrade or exit decision made with data, not opinion.

3

Core Engineer

Full ownership of modules. Green or Green+ compensation. Eligible for team lead responsibilities, client-facing work, and strategic project assignment.

Capability Growth

Tracked via quarterly reassessment and peer feedback loops

Ownership Expansion

Module scope increases as band progresses from Amber to Green+

Delivery Maturity

Measured by on-time delivery rate, defect density, and escalation frequency

Board Ask: Three Decisions That Shape Inspironics' Talent Future

1 Approve the Capability-Based Hiring Model

Formally ratify the four-dimension assessment framework and band-linked compensation structure as the standard hiring protocol for all engineering roles at Inspironics — effective immediately.

2 Standardize Across All Teams

Mandate adoption of the scoring model and compensation bands across all existing engineering teams — not just new hires. Conduct a retrospective assessment to reclassify current team members within 60 days.

3 Deploy as Valuation Narrative

Position the Capability-Based Talent Engine as a core IP asset in investor communications, due diligence materials, and ESG reporting. This model demonstrates operational sophistication and sustainable unit economics — a compelling differentiator for strategic capital.

Why Now?

Tier-2 India is at an inflection point. The talent supply is abundant, but the window to build a **proprietary capability-first culture** is narrow. Competitors are still hiring on credentials. Inspironics has the opportunity to define the new standard — and the board's endorsement today is the catalyst.

Expected Outcomes

- 30% reduction in hiring mismatches within 6 months
- Improved team delivery velocity and quality scores
- Stronger ESG talent narrative for investor decks
- Scalable model replicable across geographies
